

Instructions on running the Test API tests

- Run the json-server locally on your machine:

How to run the "Houses API" locally:

- Install npm - <https://www.npmjs.com/get-npm>

- Run command: "npm install -g json-server", if you need any additional information you can visit

this link <https://github.com/typicode/json-server>

- Unzip the attachment file and copy provided db.json file locally

- Go to the path where you copied the db.json file

- Run command: "json-server --watch db.json"

- In the IDE of your choice open the projectFile that you've Pulled from Git
<https://github.com/SrdjanBBudic/houses-json-server-api>
- Hover your mouse over the @Test and add Junit 5 library
- Note: Possible issues that occurred, the following 2 libraries have randomly been changing their paths and failing after import. If the IDE is throwing errors, go to your project BuildPath and check for the following Jars:
 1. json-2021115.jar
 2. Junit-jupiter-api-5.7.0.jarIf they are showing an error click Edit for both of them and update their path location
- Start the Test by Run as -> Junit Test
